

UNVIBE

The learning layer for AI-written code.

Founded May 16, 2026. Unvibe helps people understand, verify, and retain the code they build with AI coding tools.

THE PURPOSE

**People own
what ships.**

PRIVATE BETA

WHAT UNVIBE DOES

A macOS desktop companion that turns selected code, a file, or a change into a context-aware explanation, a lightweight comprehension check, and saved learning.

01

Select

the relevant code

02

Explain

at the right depth

03

Check

understanding

04

Save

what matters

WHO IT HELPS

Students

Learn through the projects they are actually building.

AI-assisted builders

Understand what an agent changed before the next change arrives.

Founders + teams

Keep architecture, risk, and ownership clear while moving quickly.

PRODUCT PRINCIPLE

Unvibe is not another code generator. Its job is to turn faster code creation into stronger understanding and better long-term ownership.

THE PROBLEM

AI accelerates software delivery. It does not transfer the reasoning behind the work.

The person who ships code still has to review, debug, explain, and maintain it. That is the gap Unvibe is designed to close.

INITIAL WEDGE

Start with people building faster than they understand: students, AI-assisted builders, hackathon teams, and early founders.

WHY THIS CAN COMPOUND

Each useful interaction can create a personal learning record: explanations, concepts, checks, review history, and project context. The product should become more useful as a user keeps building.

GO-TO-MARKET HYPOTHESIS

Recruit an intentional private-beta cohort through AI-builder communities, student networks, hackathons, and build-in-public product demonstrations. Convert learning moments into an invitation loop. This is a hypothesis to validate, not a claim of current traction.

BUSINESS MODEL		
FREE	PRO	TEAMS
\$0	\$8/mo	Planned
Core overlay + saved learning	\$6/mo billed annually; deeper context + study	Shared workspace + team knowledge

Honest status: Pro pricing is planned. Teams is planned and neither should be presented as validated revenue today.

WHAT MAKES THIS FUNDABLE

A clear user problem in an expanding AI-native workflow, a focused desktop product, an initial wedge with fast feedback loops, and a revenue path that can expand with project complexity. Funding depends on proving the product earns repeat use and trust.

HOW UNVIBE CAN EARN

The right to raise a pre-seed.

No deck guarantees funding. The practical path is a clear founder narrative plus evidence that a small cohort repeatedly gets value from the product.

1. BUILD A CREDIBLE BETA

Ship a reliable Mac beta with a crisp onboarding path, selected-code explanations, saved learning, sensible privacy controls, and a tight feedback loop.

2. COLLECT THE EVIDENCE INVESTORS NEED

Activation

Do invited users reach a first useful explanation?

Repeat use

Do users return to understand more than one change?

Learning value

Do people save, review, or complete checks?

Trust

Do users understand and accept the privacy model?

3. TELL A SPECIFIC INVESTOR STORY

Lead with the product demo and user learning moment. Explain the initial wedge, the behavior being measured, the revenue path, and what capital unlocks. Target investors who understand developer tools, AI workflows, education, or the creator-to-engineer transition.

WHAT FUNDING IS FOR

Product reliability

Beta polish, onboarding, and desktop quality.

AI + infrastructure

Reliable explanations, secure context handling, and sync.

Trust + learning

Privacy, feedback, retention, and comprehension evidence.

Distribution

Intentional beta cohorts and channel experiments.

TO FINALIZE A LIVE FUNDRAISE

Set the amount to raise, the runway it buys, founder/team bios, incorporation details, target investor list, and the beta metrics you will share. Keep those facts exact; do not fill them with assumptions.
